

Arkansas Health Center 2014 Annual Drinking Water Quality Report

We're pleased to present to you this year's Annual Drinking Water Quality Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our goal is to provide you with a safe and dependable supply of drinking water, and we want you to understand, and be involved in, the efforts we make to continually improve the water treatment process and protect our water resources.

Where Does Our Drinking Water Come From?

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. Our source of water is surface water from the Saline River. We also purchase water from Southwest Water Users Public Water Authority and Haskell Water. They purchase water from Benton Utilities. Benton's source is surface water from the Saline River. Southwest also purchases water from Salem Water whose source is Central Arkansas Water (CAW). (CAW's) source is surface water from Lake Winona and Lake Maumelle.

How Safe Is The Source Of Our Drinking Water?

The Arkansas Department of Health has completed a Source Water Vulnerability Assessment for Arkansas Health Center. The assessment summarizes the potential for contamination of our source of drinking water and can be used as a basis for developing a source water protection plan. Based on the various criteria of the assessment, our water source has been determined to have a low susceptibility to contamination. You may request a summary of the Source Water Vulnerability Assessment from our office.

What Contaminants Can Be In Our Drinking Water?

As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include: Microbial contaminants such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; Inorganic contaminants such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming; Pesticides and herbicides which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses; Organic chemical contaminants including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems; Radioactive contaminants which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to assure tap water is safe to drink, EPA has regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Am I at Risk?

All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. However, some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from small amounts of contamination. These people should seek advice about drinking water from their health care providers. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791. In addition, EPA/CDC guidelines on appropriate means to lessen the risk of infection by microbiological contaminants are also available from the Safe Drinking Water Hotline.

What is Cryptosporidium?

Cryptosporidium is a microbial pathogen found in surface water throughout the U.S. It lives and reproduces only with the host. In the environment, *Cryptosporidium* exists as a thick walled oocyst, containing four organisms. Monitoring by Central Arkansas Water in 2014 indicated no presence of these organisms in their Lake Maumelle, Lake Winona, or Jackson Reservoir water sources. It is important to know that although filtration removes *Cryptosporidium*, the most commonly used filtration methods cannot guarantee 100 percent removal. Ingestion of *Cryptosporidium* may cause cryptosporidiosis, an abdominal infection. Symptoms of infection include nausea, diarrhea, and abdominal cramps. Most healthy individuals can overcome the disease within a few weeks. However, immuno-compromised people are at greater risk of developing life threatening illness. We encourage immuno-compromised individuals to consult their doctor regarding appropriate precautions to take to avoid infection. *Cryptosporidium* must be ingested to cause disease, and it may be spread through means other than drinking water.

Lead and Drinking Water

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. We are responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking.

If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

Who Can I Contact With Questions About Our Drinking Water?

If you have any questions about this report or concerning your water utility, please contact David Burks, Water Plant Supervisor, at 501-860-0620. We want our valued customers to be informed about their water utility. Our water system currently holds no public meetings. If you want to learn more, please contact David Burks.

TEST RESULTS

We, Central Arkansas Water, Southwest Water Users, Benton Utilities and Salem Water routinely monitor for constituents in your drinking water according to Federal and State laws. The test results table shows the results of our monitoring for the period of January 1st to December 31st, 2014. In the table you might find terms and abbreviations you are not familiar with. To help you better understand these terms we've provided the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - unenforceable public health goal; the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) - the highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) - the level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

NA - not applicable

Nephelometric Turbidity Unit (NTU) - a unit of measurement for the clarity of water. Turbidity in excess of 5 NTU is just noticeable to the average person.

Parts per billion (ppb) - a unit of measurement for detected levels of contaminants in drinking water. One part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

Parts per million (ppm) - a unit of measurement for detected levels of contaminants in drinking water. One part per million corresponds to one minute in two years or a single penny in \$10,000.

MICROBIOLOGICAL CONTAMINANTS						
Contaminant	Violation Y/N	Level Detected	Unit	MCLG (Public Health Goal)	MCL (Allowable Level)	Major Sources in Drinking Water
Total Coliform Bacteria (Arkansas Health Center)	N	None	Present	0	1 positive sample per month	Naturally present in the environment

MICROBIOLOGICAL CONTAMINANTS										
Contaminant	Violation Y/N	Level Detected	Unit	MCLG (Public Health Goal)	MCL (Allowable Level)	Major Sources in Drinking Water				
Turbidity (Arkansas Health Center)	N	Highest yearly sample result: 0.28 Lowest monthly % of samples meeting the turbidity limit: 100%	NTU	NA	Any measurement in excess of 1 NTU constitutes a violation	Soil runoff				
Turbidity (Benton Utilities)	N	Highest yearly sample result: 0.11 Lowest monthly % of samples meeting the turbidity limit: 100%			A value less than 95% of samples meeting the limit of 0.3 NTU, constitutes a violation					
Turbidity (Central Arkansas Water)	N	Highest yearly sample result: 0.21 Lowest monthly % of samples meeting the turbidity limit: 100%								
♦ Turbidity is a measurement of the cloudiness of water. We monitor it because it is a good indicator of the effectiveness of our filtration system.										
INORGANIC CONTAMINANTS										
Contaminant	Violation Y/N	Level Detected			Unit		MCLG (Public Health Goal)	MCL (Allowable Level)	Major Sources in Drinking Water	
Fluoride (Arkansas Health Center)	N	Average: 0.72 Range: 0.50 – 1.31	ppm	4	4	Erosion of natural deposits; water additive which promotes strong teeth				
Fluoride (Benton Utilities)	N	Average: 0.695 Range: 0.52 – 0.90								
Fluoride (Central Arkansas Water)	N	Average: 0.69 Range: 0.52 – 0.91								
LEAD AND COPPER TAP MONITORING										
Contaminant		Number of Sites over Action Level	90 th Percentile Result	Unit	Action Level	Major Sources in Drinking Water				
Lead (Arkansas Health Center)		0	0.008	ppm	0.015	Corrosion from household plumbing systems; erosion of natural deposits				
Copper (Arkansas Health Center)		0	<0.20	ppm	1.3					
♦ We are currently on a reduced monitoring schedule and required to sample once every three years for lead and copper at the customers’ taps. The results above are from our last monitoring period in 2014. Our next required monitoring period is in 2017.										
TOTAL ORGANIC CARBON										
♦ The percentage of Total Organic Carbon (TOC) removal was routinely monitored in 2014, and all TOC removal requirements set by USEPA were met. Total organic carbon (TOC) has no health effects. However, total organic carbon provides a medium for the formation of disinfection by-products. These by-products include trihalomethanes (THMs) and haloacetic acids (HAAs).										
REGULATED DISINFECTANTS										
Disinfectant	Violation Y/N	Level Detected	Unit	MRDLG (Public Health Goal)	MRDL (Allowable Level)	Major Sources in Drinking Water				
Chlorine (Arkansas Health Center)	N	Average: 1.33 Range: 0.9 – 2.0	ppm	4	4	Water additive used to control microbes				
BY-PRODUCTS OF DRINKING WATER DISINFECTION										
Contaminant	Violation Y/N	Level Detected		Unit	MCLG (Public Health Goal)	MCL (Allowable Level)				
HAA5 [Haloacetic Acids] (Arkansas Health Center)	N	Highest Running 12 Month Average: 32 Range: 11.5 - 47.2		ppb	0	60				
TTHM [Total Trihalomethanes] (Arkansas Health Center)	N	Highest Running 12 Month Average: 72 Range: 45.6 – 81.7		ppb	NA	80				
Chlorite (Central Arkansas Water)	N	Average: 200 Range: 20 - 605		ppb	800	1000				
♦ While only the upper end of the TTHM range exceeded the MCL, it should be noted that some people who drink water containing Trihalomethanes in excess of the MCL over many years may experience problems with their liver, kidneys, or central nervous systems, and may have an increased risk of getting cancer.										

UNREGULATED CONTAMINANTS				
Contaminant	Level Detected	Unit	MCLG (Public Health Goal)	Major Sources in Drinking Water
Chloroform (Arkansas Health Center)	Average: 45.75 Range: 30.7 – 60.8	ppb	70	By-products of drinking water disinfection
Chloroform (Benton Utilities)	10.3			
Chloroform (Central Arkansas Water)	Average: 18.15 Range: 6.89 - 29.4			
Bromodichloromethane (Arkansas Health Center)	Average: 7.67 Range: 6.29 – 9.08	ppb	0	
Bromodichloromethane (Benton Utilities)	5.78			
Bromodichloromethane (Central Arkansas Water)	Average: 4.21 Range: 1.20 - 7.22			
Dibromochloromethane (Arkansas Health Center)	Average: 0.85 Range: 0 – 1.70	ppb	60	
Dibromochloromethane (Benton Utilities)	2.19			
Dibromochloromethane (Central Arkansas Water)	1.96			
Strontium (UCMR3) (Salem Water)	Average: 35.6 Range: 12.2 – 58.6	ppb	Undetermined	Naturally-occurring element; historically, commercial use of strontium has been in the faceplate glass of cathode-ray tube televisions to block x-ray emissions
Vanadium (UCMR3) (Salem Water)	0.26	ppb	Undetermined	Naturally-occurring elemental metal; used as vanadium pentoxide which is a chemical intermediate and a catalyst
Chromium-6 (UCMR3) (Salem Water)	Average: 0.047 Range: 0.043 – 0.051	ppb	Undetermined	Naturally-occurring element; used in making steel and other alloys; chromium-3 or -6 forms are used for chrome plating, dyes and pigments, leather tanning, and wood preservation
Chlorate(UCMR3) (Salem Water)	Average: 97.4 Range: 62.8 - 132	ppb	NA	Undetermined Agricultural defoliant or desiccant; disinfection byproduct; and used in production of chlorine dioxide
♦ Unregulated contaminants are those for which EPA has not established drinking water standards. The purpose of unregulated contaminant monitoring is to assist EPA in determining the occurrence of unregulated contaminants in drinking water and whether future regulation is warranted. MCLs (Maximum Contaminant Levels) and MCLGs (Maximum Contaminant Level Goals) have not been established for all unregulated contaminants.
